Dec 2008

Nintendo Wii

Nintendo's 5th Video game console

Release Date: 11/19/06

35 million units worldwide (Sept '08)

>35 million Wii remotes
1-4 remotes per console

7-10 million Tablet PCs

Nintendo Wii Remote

Bluetooth HID compatible joystick
MSRP \$40 USD

Inputs:

IR camera tracker
Accelerometer
12 digital buttons

Outputs:

Tactile – vibration motor
Auditory – small speaker
Visual – blue status LEDs

Other:

Expansion port
On-board memory
Batteries

IR Camera Tracker

Manufactured by PixArt Imaging
Multi-Object Tracking™ engine (MOT sensor™)

Official specifications are confidential, but....

Hardware IR blob tracking up to 4 points

Resolution: 1024x768 (true: 128x96)

Refresh Rate: 100Hz – 200Hz via I2C

Dot size: 4-bits

Intensity: 8-bits

Bounding Box: 7-bits x-y

Horizontal Field of view: 45 degrees

Nintendo Wii “Sensor Bar”

Contains two IR emitter groups

Two dots = 4 values: $(x1, y1)$, $(x2, y2)$

4 values \rightarrow ***x***, ***y***, ***rotation***, and ***distance***

correspond primarily to: *tilt*, *yaw*, *roll*, and *distance*

Accelerometer

Analog Devices (ADXL330)

3-axis linear accelerometer

Range: $\pm 3g$ sensitivity

Resolution: 8 bits/axis

Sample Rate: 100Hz

Buttons

Total of 12 digital buttons
11 are accessible to an application

Power button - initiates and terminates
Bluetooth connection

Ambidextrous design
4 buttons arranged in a D-pad

Index finger trigger button (B)
Primary thumb button (A)

Output

Tactile – Vibration motor, up to 100Hz update rate

Auditory – Small speaker, 4Khz*, 4-bit audio streamed from host, approx telephone quality.

Visual – Four blue LEDs, player ID, individually addressable, up to 100Hz update rate

Other Features

Bluetooth – Broadcom 2042 for Human Interface Devices (HIDs). Not 100% compliant, but compatible with PCs.

Expansion Port – Proprietary 6-pin connector. Provides power and Fast I2C communication. Acts as a Bluetooth to I2C bridge.

Onboard Memory – device configuration and ~ 5KB of general memory. Physical association of data and identity with a remote.

Batteries – two AA batteries provide 20-30 of operation. 8-bit battery level sensor.

Developing Custom Applications

Bluetooth HID joystick compatible with HID driver libraries.

Libraries available for nearly every major development platforms on Windows, MacOS, and Linux.

Visit <http://wiili.org> or <http://wiibrew.org>

Brain Peeks C# managed WiimoteLib
Read values from data structure to access data
Most libraries include a sample program

Eventual support:
Better Event-handling
Related geometric transformations
Gesture Recognition

Interaction Techniques

Game Interaction – Pointing

Selection/Navigation

Aiming a weapon/tool

project 1

Finger and Object Tracking

Finger and Object Tracking

Wii remote can track any IR emitter
Active emitters can be cumbersome

Finger and Object Tracking

Vicon Motion Capture System

Video – Finger Tracking

Object Tracking - Limitations

Only 4 points – limitation of Wii remote, but good for the price.
Temporal multiplexing, multiple remotes

No inactive cursor feedback → 4 point index finger and thumb tracking with pinch detection.

Arm Fatigue → Table top or transparent surfaces. Reflective tags may need repositioning.

Unintentional Reflections → Active IR emitters when possible.
Can be installed in handheld or wearable devices (e.g. sports equipment, animal tracking).

project 2

Interactive Whiteboards

Multi-Point Interactive Whiteboards

- Point Wii remote at display
- Map camera coordinates to display coordinates
- 4-point touch calibration (homography)
- Simulate mouse cursor

Effective electronic whiteboard system for **\$50**

Video/Demo – Whiteboard

Interactive Whiteboards - Limitations

Maximum 1024x768 resolution.
Dependent on good camera positioning.
Sensitive to occlusion.

Solutions

Adjust camera position (over-head)
Use multiple Wii remotes
Use rear projected displays.

80% of the way there
1% of the cost

Everyone

Two Effects:

1. Increased participation:

Advances the state of research

2. Increased practicality:

Advances the state of technology

6 million ~ = sold out shows 5 times a week for 10 years

Motion Parallax

www.flickr.com/photos/kap_cris/472159801/

- Very important depth cue
- Velocity of objects when moving
- Occlusion behavior

[Ware, Arthur, and Booth CHI'93]

Motion parallax is more important than stereo

Calculating Head Position

Horizontal Position

Vertical Position

Limitations

Perspective is correct for only 1 person – split screen or shutter glasses

Limited Tracking Volume – increase field of view with wide angle lens or use multiple remotes.

Can't touch objects – Sorry. Keep objects behind the display surface and blame the display.

Conflicting Stereo Depth Cues – weakens the effect, use stereoscopic display technology (polarized/shutter glasses, etc)

Anaglyph (red/blue): bad color fidelity, but would work, cheap

Polarized glasses: does not work with most existing consumer televisions, cheap

Shutter glasses: active device, frame sync, higher frame rates (120Hz okay)

Auto-stereoscopic: not consumer technology yet

If you can't provide stereo, removing the conflicting stereo depth cues **will improve** the head tracking illusion.

Nigel Tzeng – NASA Whirlwind

project 4

Spatial Augmented Reality

Spatial Augmented Reality

Shader Lamps, Raskar et al UNC/MERL

Everywhere Displays, Pinhanez et. al, IBM

Projected light can be used to augment the appearance of physical objects.

Aligning to static objects can be done manually.

Moving objects requires low-latency, high-resolution tracking.

1024x768 @ 100Hz tracking of the Wii remote is quite good.

Video – Foldable Displays

Limitations

Wii remote only tracks 4 points.

- Limits the number of objects
- Limits the geometric complexity

4 points can track arbitrary quadrilateral

Assumptions reduces necessary points

- square surface
- constrained to a plane

Other projects: 3D tracking

Simon Hay, University of Cambridge

Other projects ...

Tracking with ID – currently no point ID. Use high-speed IR receiver in conjunction with camera should allow location with ID.

IR Glyphs – use varying spatial and temporal behavior of 4 IR emitters to create unique IDs. Allows Wii remote to know what object it is pointing at.

Laser Tag – instrument each Wii remote with IR emitters so they can see each other. ID can be temporally verified.

Wii remotes

>35 million Wiimotes
Sophisticated I/O capabilities
Only \$40 USD

Vast number of applications
limited only by creativity

Step 3:

Decode location for application

Low-Cost EEG for Task Classification in HCI Research

National Geographic, March 2005

NY Times Magazine, October 16, 2005

EEG Devices

Manufacturer: EGI Systems
Channels: 128-512
Cost: **\$100K-\$250K USD**

Manufacturer: BioSemi
Channels: 64-128
Cost: **~\$30K USD**

The Brainmaster

Lowest cost FDA approved device
Designed for home and small clinical use.
Only \$1500 USD

Specs:

- 2-channels
- 8-bit at $4\mu\text{V}$ resolution
- 256 samples/sec

Needs to be validated for BCI research work.
If it works, it **lowers the entry bar** for BCI research.

Mean Classification Accuracy vs. Averaging Scenarios (Mental Tasks)

Error bars represent standard deviation

human as a sensor

Muscle-Computer Interfaces

Pressure, Position, Tap, Lift

Haptic Pen_(MERL - 2004)

> \$2000 USD

[Poupyrev and Maruyama, UIST 2003]

One touch, one person, small screens

Goals: Support large touch-sensitive displays.
Support multiple simultaneous users.

Solution: Haptic Pen

- Individualized feedback
- Pressure Sensitivity
- Hover tracking data
- Feedback not bound to display
- Aftermarket device
- Low-cost (~\$10)

Pressure sensitivity allows variable feedback/activation

Multi-level buttons also possible (camera shutter)

On-axis feedback **more** accurate than vibration

Light Button

Stiff Button

\$14 Steadycam₍₂₀₀₀₎

\$6000-\$10,000

\$14

Over **1.4M** views (not including syndication)
Over **\$250K** in revenue

Staple of independent/student filmmaking community.
Used in many high-school and college programs.

If you create technology that is **accessible**, you can advance the state of humanity (if only a little)

2-3 orders of magnitude

- Augmented reality
- Multi-touch surfaces
- Immersive Displays
- Brain-Computer Interfaces
- Haptics
- Filmmaking
